

PROBLEM STATEMENTS FOR OCP 2.0

The below focus area is not restricted, any other innovative solution closed to below focus areas may also be considered for evaluation.

| S. No. | Focus Area | Description | What Expected |
|--------|--|---|---|
| 1. | Digital Financial Inclusion | Despite advancements in digital banking and payment solutions, a large section of the rural and semi-urban population in India still lacks access to basic financial services. | How might we design and deliver easy- to-use, low-cost fintech solutions that cater to the needs of the financially underserved or excluded, especially in regions with limited internet access and digital literacy? |
| 2. | Fraud Detection & Cyber Security | Fintech platforms are increasingly becoming targets of sophisticated fraud and cyber attacks. | How might we develop real-time, AI- driven security solutions that can proactively detect and mitigate financial fraud and ensure data privacy without affecting user experience? |
| 3. | KYC and Onboarding Efficiency | Lengthy and cumbersome KYC (Know Your Customer) processes lead to high dropout rates and delayed customer acquisition. | How might we streamline KYC processes using digital tools such as e- KYC, video verification, or blockchain to improve onboarding speed, accuracy, and compliance? |
| 4. | Trust and Transparency | Many consumers still hesitate to use digital financial services due to a lack of trust and understanding of how their data and money are handled. | How might we build greater transparency, trust, and financial literacy into fintech platforms, especially among first-time digital users? |
| 5. | Credit Scoring for the Underserved | Traditional credit scoring models exclude individuals with no formal credit history, preventing them from accessing loans or credit-based services. | How might we create alternative credit scoring systems using unconventional data (e.g., mobile usage, utility payments, behavioral data) to assess creditworthiness of new-to-credit customers? |
| 6. | Cyber Fraud & Money Tracing Back to the Victim | Despite growing digital literacy and advanced cyber security tools, cyber fraud continues to rise rapidly, exploiting loopholes in financial systems, social engineering tactics, and digital payment ecosystems. | To design and implement a robust, scalable, and real-time mechanism that: <ul style="list-style-type: none"> · Enables seamless tracing of fraudulent digital financial transactions across multiple |
